

Use-Case Flow: UC-02 Import Bank Transactions

Personal Subscription & Recurring Expense Auditor — Problem Statement #32

Primary Actor	Individual User
Secondary Actor(s)	Banking Data Provider (external transaction feed / aggregator)
Includes	UC-01 Authenticate User, UC-03 Detect Recurring Subscriptions
Trigger	The Individual User chooses to import or refresh their bank transaction data (manual upload of a CSV/OFX file, or a connected feed sync).

Preconditions

1. The Individual User has a valid, active account.
2. The user has either a CSV/OFX export file ready to upload, or an already-linked Banking Data Provider connection.
3. The Banking Data Provider service (if using a live connection) is reachable and the user's linked credentials/token are valid.

Postconditions

Success: New transactions are stored, categorized, and merged with existing records without duplicates; any newly detected recurring subscriptions are logged with a projected renewal date; the burn-rate dashboard reflects the updated data.

Failure: No partial or corrupted transaction data is persisted; the user sees a specific error and the previous dataset remains unchanged.

Main Success Scenario

1. User logs in to the app (include: UC-01 Authenticate User).
2. User selects "Import Transactions" and chooses a source: upload a CSV/OFX file, or sync the linked Banking Data Provider feed.
3. System retrieves the transaction data (reads the uploaded file, or requests the latest feed from the Banking Data Provider over a secure, encrypted channel).
4. System validates the file format / feed response and parses individual transactions without storing raw banking credentials in cleartext.
5. System deduplicates against existing records and merges only new transactions into the user's transaction log.
6. System analyzes the updated transaction log to identify recurring billing patterns (include: UC-03 Detect Recurring Subscriptions).
7. System recalculates the monthly burn rate and updates the dashboard.
8. System displays an import summary: number of new transactions, newly detected subscriptions, and updated burn rate.
9. Use case ends successfully.

Alternate Flow — A1: Import Source Unreachable or Invalid

Branches from step 3 of the Main Success Scenario.

- 3a1.** System cannot reach the Banking Data Provider (timeout/auth failure), or the uploaded file fails format validation (corrupt or unsupported file type).
- 3a2.** System aborts the import without modifying the existing transaction log or dashboard.
- 3a3.** System displays a specific error message (e.g., "connection to bank feed failed" or "unsupported file format") and suggests a next step (retry, re-link account, or re-export the file).
- 3a4.** User may retry the import (resume at step 2) or cancel; use case ends without persisting any changes.
